## February 2015 Now Snowiest February in Denver History!

February of 2015 monthly snowfall surpassed the long standing record snowfall of 22.1” set over 100 years ago in 1912! At DIA 22.4” of snow was measured for the month with much higher amounts for some of the Denver suburbs in the 25-35” range! Below is the daily breakdown by day for DIA:

DY	MAX	MIN	AVG	DEP	HDD	CDD	WTR	SNW	DPTH	SPD	SPD	DIR	MIN	PSBL	S-S	WX	SPD	DR

There were 13 days during the month with snowfall of a trace or more and 10 days with measureable snow at DIA. Of the 10 days greater than a trace, 6 days reported 1" or more of snow with a maximum of 6" on February 21<sup>st</sup>. Moisture from the 22.4" of snow produced 1.25" of liquid which resulted in a 17.9" snow to 1" water ratio for the month. Spring storms can average between 6-10" snow to 1" of water so the cold temperatures while it was snowing definitely helped produce a "drier" and powdery" snow which easily accumulated all surfaces.

Below are the snow totals for many communities around the Front Range for the month of February.

## Is February Becoming Our “New” March?

With 2 of the top 3 February snowfall records in just the past 4 years is February becoming our new March? March is well known as a month with heavy snowfall potential but since 2012 there has been more snow in February on average than in March. Even though DIA set the all time record snowfall for February this year many locations actually received more snow in 2012 than in 2015. Below are the February and March snowfall totals since 2012. (Averages for February = 4years, Average for March = 3years).

Location	Feb 2012	Mar 2012	Feb 2013	Mar 2013	Feb 2014	Mar 2014	Feb 2015	Avg Feb	Avg Mar

With such a small sample size we cannot come to the conclusion that February is now snowier than March but since 2012 nobody can argue that February has produced more snow on average. What do we expect for this March? Well... For March of 2015 we have equal chances for above and below normal precipitation which typically means that March will end up somewhere near normal in snowfall, but all it takes is one "big" storm to make or break a month.

Remember that Skyview Weather snow totals are not official snow fall totals and typically contain estimates for missing or partial data but are a good representation of snowfall for a particular area.

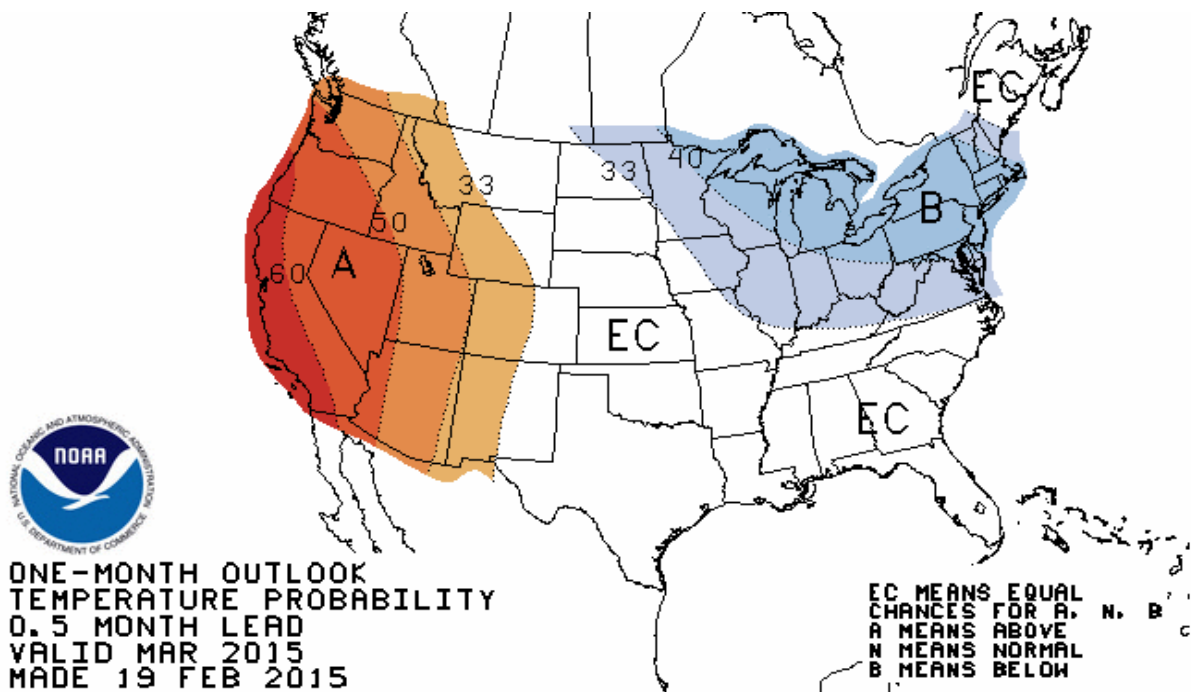

# Drought Update

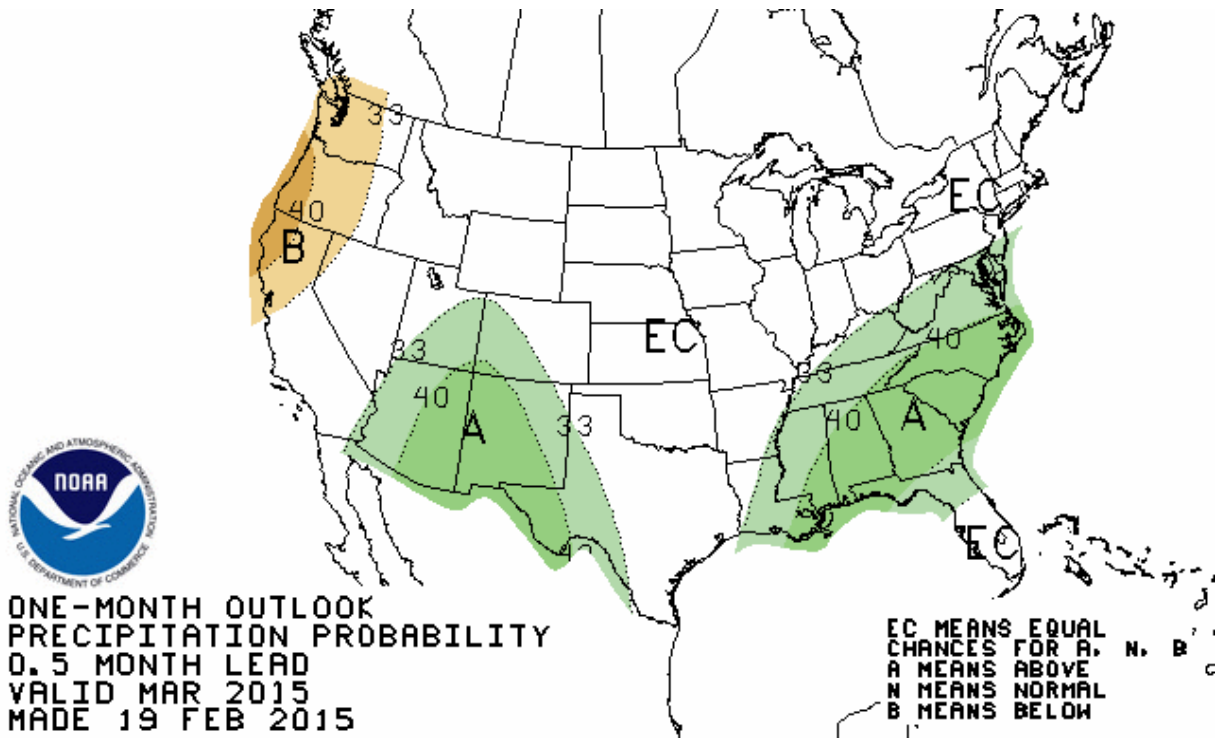

Drought severity has eased over portions of AZ and NM with exceptional drought over a large area of CA/NV persisting. Drought free conditions over NE Colorado with moderate drought over the W and SE portions of the state.

The map below shows forecasted temperature deviances for March 2015. There is a bias towards above normal temperatures over western Colorado and equal chances for above and below normal temperatures for areas east of the Continental Divide.

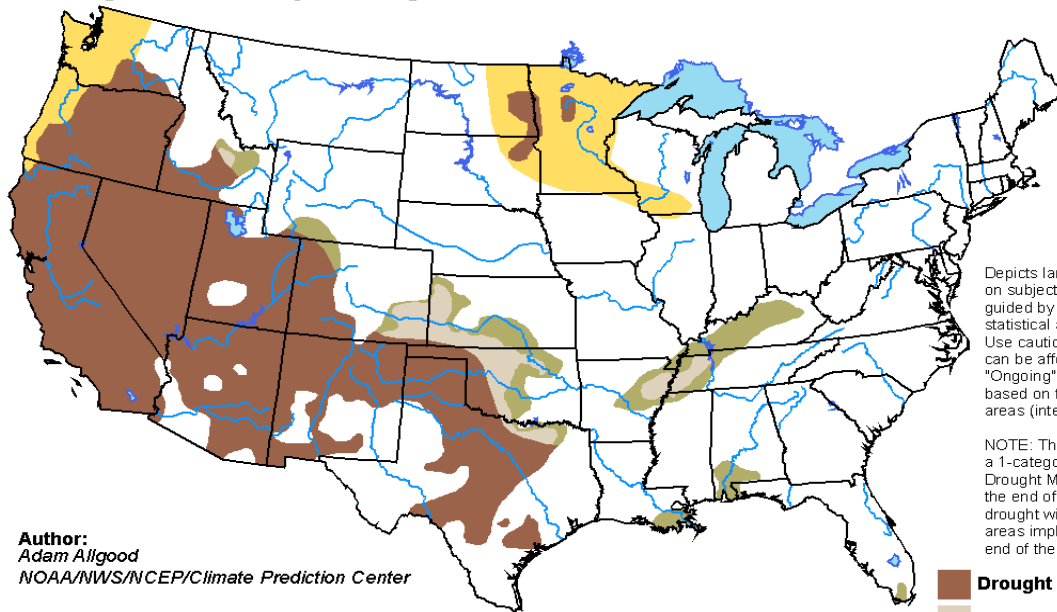

The map below shows forecasted precipitation deviances for March 2015. Equal chances for above or below normal precipitation is forecast for NE Colorado.

Drought conditions are forecast to improve over SE Colorado. Drought looks to persist or intensify over the west Coast inland through the Great Basin as well as western Colorado.

**U.S. Seasonal Drought Outlook**  
Drought Tendency During the Valid Period

Valid for February 19 - May 31, 2015  
Released February 19, 2015

Depicts large-scale trends based on subjectively derived probabilities guided by short- and long-range statistical and dynamical forecasts. Use caution for applications that can be affected by short lived events. "Ongoing" drought areas are based on the U.S. Drought Monitor areas (intensities of D1 to D4).

NOTE: The tan areas imply at least a 1-category improvement in the Drought Monitor intensity levels by the end of the period, although drought will remain. The green areas imply drought removal by the end of the period (D0 or none).

Author:  
Adam Allgood  
NOAA/NWS/NCEP/Climate Prediction Center

- Drought persists/intensifies
- Drought remains but improves
- Drought removal likely
- Drought development likely

## February Summary

Of 2015 will go down as the snowiest February in Denver history and resulted in a greater than 6" snow deficit at the start of the month being erased with a greater than 10" surplus at month's end. 22.4" of snow was measured at DIA but many other Denver suburbs reported even higher amounts. Despite all of the snow the month ended up with above normal temperatures, mainly due to record breaking heat early on in February. The average high was 46.6 degrees compared to 46.2 on average. The average low for the month was 21 degrees, about 2 degrees above the normal of 18.9 degrees. The average monthly highs and lows combined to produce a monthly mean temperature of 33.8 degrees which was 1.3 degrees above the normal of 32.5 degrees. There were multiple high temperature records broken during the month on 2/6, and 2/7 with record high minimum temperatures on those same days. Most of the month was abnormally warm or cold with very few days actually being near normal. With all of the snow the precipitation for the month was well above normal at 1.25" compared to only 0.37" on average. For the year now DIA has tallied 1.63" of moisture which results in a surplus of 0.85" for the year so far. There was an abnormally high amount of days with fog producing low visibility with 8 days reported at DIA with visibility of ¼ mile or less. Typically there are only 2 days during the month with heavy fog. Additional February information can be found in the newsletter article.

*Note: The 0.3"(1/31) and 0.9"(2/1) from the storm on January 31<sup>st</sup> into the pre dawn hours on February 1<sup>st</sup> are combined for snow totals for DIA on our snow reports and will result in a surplus for January snow and a deficit for February snow if you are logging totals from our individual storm reports.*

## March Preview

Almost any kind of weather can occur in March whether it is snow, rain, sleet, graupel or even thunderstorms. March is best known as a Denver's "snowiest" month of the year with 10.7" of snow on average. Precipitation in general increases with 0.92" of moisture on average. Most of us have lived through some March extremes with the snowiest March ever in 2003 at 35.2" (most of which was from a single storm) and the least snowiest in 2012 with only a trace. Towards the end of the month it is common for storms to begin as rain lower elevations then change over to snow as the storm progresses. Snow accumulations pavement become less and less likely with snow storms as more sunshine begins to warm the ground. There is a time change on the 8<sup>th</sup> of the month but sunrise on March 1<sup>st</sup> is 6:34am and sunset is 5:51pm. By month's end the sun rises at 6:47am and sets at 7:22pm which equates to 78 additional minutes of sunshine. With the extra sun the temperatures begin to warm with average highs to start the month at 50 degrees and by month's end are at 58 degrees. Average lows also change 8 degrees starting the month at 22 degrees and ending the month with an average low of 30. Temperatures below zero can occur but become less and less common. The record low for the month of March is -11 degrees with a record high of 84 degrees (95 degree temperature spread). March of 2015 is expected to be near normal in temperature and near normal to slightly above normal in precipitation and snowfall.

### DENVER'S MARCH CLIMATOLOGICALLY NORMAL (NORMAL PERIOD 1981-2010 DIA Data)

#### TEMPERATURE
